

Supplementary Table 1

hMLH1/hMSH2 Gene Variants

NB: All the gene variants listed below have been published in the ICG-HNPCC database, or in other relevant papers. It should be noted, however, that the various sources differ considerably in the way alterations are presented, and the amount of detail provided. The authors of this review have interpreted the available information for presentation in the format shown, and in some cases have inferred details not specifically given in the original publication. In several instances, variants have been published which are inconsistent with the consensus sequence of hMLH1/hMSH2, and could not easily be re-interpreted. In such cases, variants have been entered as given in the publication, with possible alternative interpretations given afterwards in Italics.

Spaces within the table indicate that relevant information was not available.

The ‘cancer’ column lists the types of cancer found in the affected kindred(s). The extent to which such information is provided varies considerably, and in many cases very little clinical information is provided. Information in this column should thus be interpreted with particular care.

In the ID column, identification codes separated by commas refer to different families with identical alterations, whereas identification codes separated by a forward slash refer to the same kindred, which has been included in more than one publication under different IDs.

Classification of mutations, as given in the mutation/polymorphism (M/P) column, has been performed by the authors of the review for the purpose of summarising the information contained in this table, and is based on the predicted consequences of each variant, incorporating the results of functional assays where available. These classifications do not necessarily reflect the interpretation given in the original publications.

Although the functional domains of the bacterial homologues of hMLH1 and hMSH2 have been studied, information specific to the human genes is scarce. This issue has been addressed in several recent papers [Schmutte et al., 2001;Tomer et al., 2002;Kondo et al., 2001], but details remain to be confirmed and discussion of the current evidence is outwith the scope of this review.

(a)

Germline hMLH1 Alterations

ID	EXON	Nucleotide Change	cDNA change	Cancer	Origin	Frequency	Reference	ICG	M/P
